

JAWA Management Software GmbH

Specialists from Graz designed and developed a customized software system. The solutions are optimized according to the provided requirements and are therefore more efficient than other standard software. This means that the customer doesn't have to adjust his processes to the software

On the spot software - for you, too!

The business areas of the innovative Graz company, which was founded in 1998, comprises software development (web application, management systems, production related control systems, medical information systems) web pages with dynamic contents, hosting (web server), EDP-support, consulting with the carrying out of EDP-projects and especially the product "Inforum".

"That is one of the developed frameworks", explains the CEO Hannes Jank who, in the early 80s, developed projects for the automobile industry (Ford, Audi and BMW). "Inforum is a comprehensive class library which can be efficiently used to develop platform independent websites with dynamic contents up to large web applications and portals. Precisely, there are Inforum-"packages" as a content-management-system for project and for supplier management as well as for "action management".

The QPF example for Magna Steyr:

The best way to describe the "Inforum" -functions by JAWA is to take a look at the "quality platform" of Magna Steyr.

"The fast and smooth exchange of information with customers and suppliers along the entire chain of production realisation through the QPF is a considerable competitive advantage", the experts of Magna Steyr confirm. The quality platform is a web-and database based communication platform which enables the management to follow the entire chain of production

JAWA manager Hannes Jank

realization based on "Planning – Controlling – Protecting – Upgrading". The QPF serves to structure and document supplier management based on the basis of the quality management. "The system will be used for various projects with project-specific data rooms and ensures the staff of Magna Steyr and the customers and suppliers an easy and fast online-access to the central database", explains Jank.

Great references!

With the development of "Inform" as a software basis, JAWA has created various modules such as project management, logging of current tasks, documentation of important data, 7-steps problem solutions as well as carrying out complaints. JAWA has carried out this project in close collaboration with Magna Steyr. Future extensions and international operations are planned. For Magna Powertrain JAWA has created a similar "Inforum"-platform, the quality database.

Another good example for the successful implementation of "Inforum" is the web presence of the leading Styrian conductor board producer AT&S. JAWA has technically realised this company for seven years and impresses with its modern design, a clear structure and numerous features such as daily updated data and the regular Live coverage of press conferences.

"Interested people and investors admire the well arranged and user-friendly edited information on the webpage of AT&T", Jank says happily and full of legitimate pride. "This is proven by almost one million accesses from all around the world within one month".

According to Jank the ideal target audiences are, beside the producing companies mainly in the automobile industry and their suppliers, the ones that look for instance for a supplier portal, because his solution of the

JAWA also makes **your IT "run"** – a real "business marathon"!

supplier management supports not only the supplier application to the supplier development and problem solving but also the carrying out of online-complaints.

This can be used immediately!

However, there are also other branches which need structured teamwork such as projects or change management. Moreover, companies that have more than one headquarter or factory might be of interest because with the web based solution of JAWA a local setting up is not needed and work can be started immediately.

"We want to be the number one provider for B2B-platforms (e. g. web pages with supplier portals) in Europe", Jank adds at the end of the NEW BUSINESS exclusive interview.
